

Biology Ch 1

Biology

- **Bio-logy made of two latin/greek words**
- ***Bios and logos***
 - *Bios means life*
 - *logy means study*
- ***What is living? (What makes something alive?)***
 - 1. capturing and using energy and materials.(Metabolism)
 - 2. growth and development.
 - 3. reproduction
 - 4. definite life span
 - 5. adjustment to changing conditions. (Homeostasis)

Communities Environments & Ecosystem

- Community-
 - A natural occurring group of *interacting organisms*
 - Organisms depend on each other
 - The communities there are different organisms that have different roles
- Environment-
 - everything *that surrounds* a particular organism both living and non living
- Ecosystem –
 - All the *communities collectively together* that live in an area together and their environments

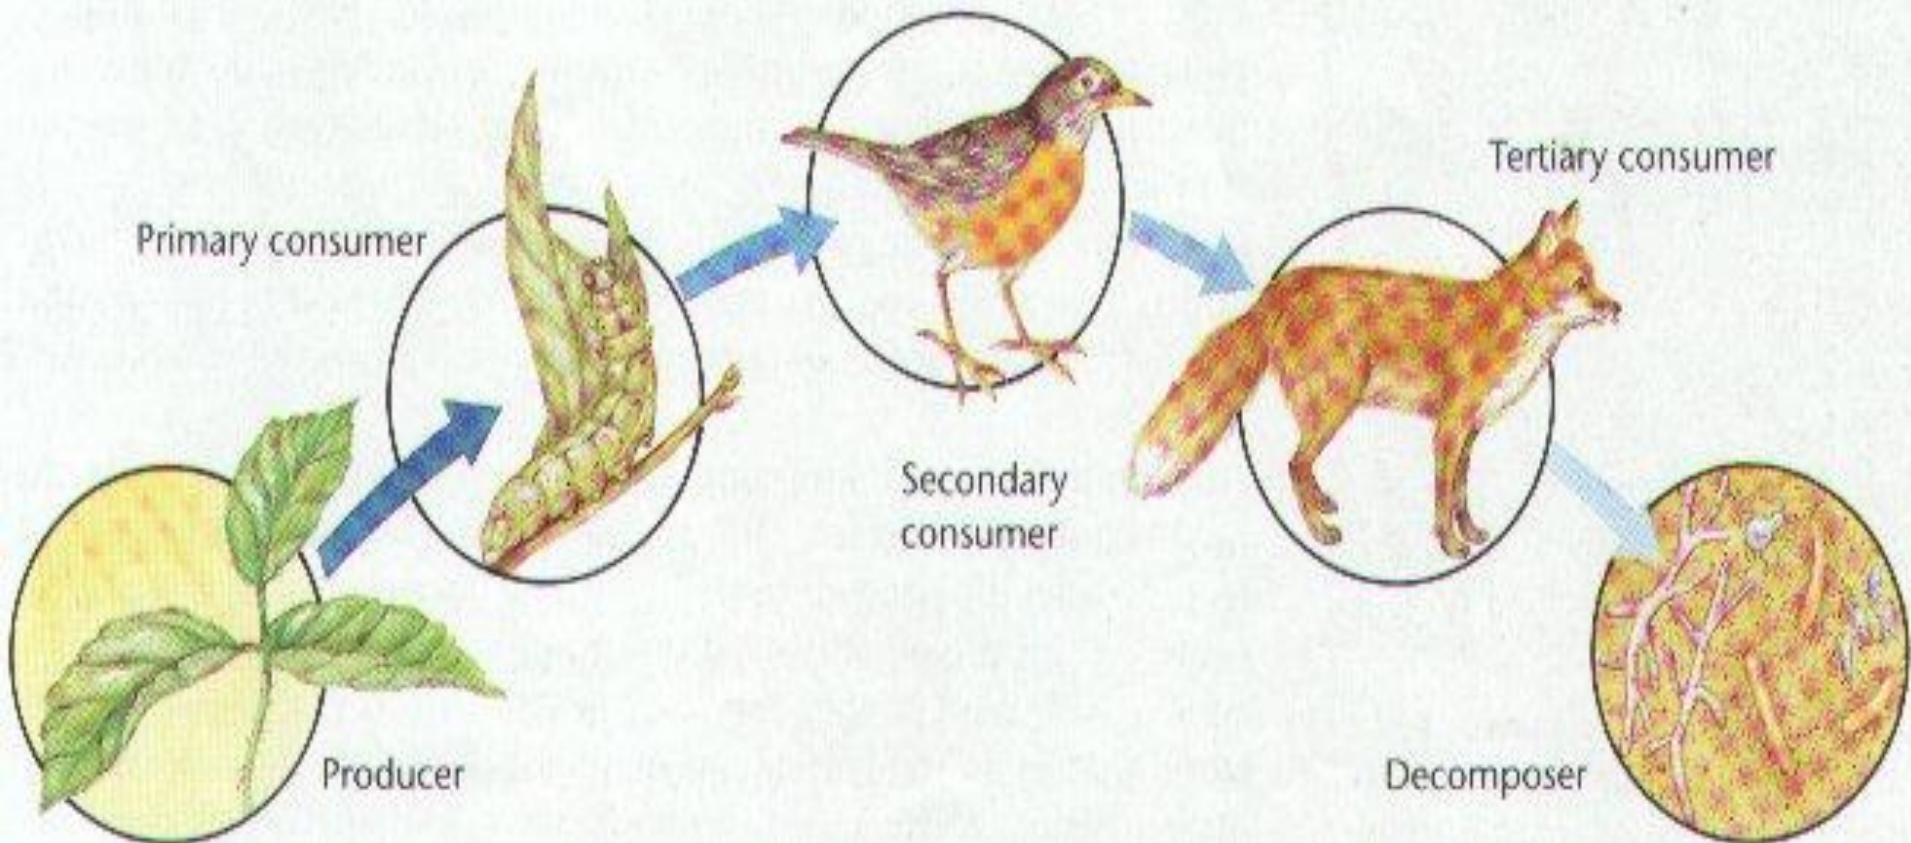

*Know the difference between the three **

Types of Organisms

- **Producers- Green plant- Organisms that produce their own food**
- **Consumer- Eats other organisms**
 - Herbivore
 - Carnivore
 - Omnivore
 - **Saprophyte: An organism that gets its food from the waste products of other living organisms Example Mushroom**
 - **Decomposer – organism that causes decay**
 - **Symbiosis – two organisms that live together**
 - **Mutualism ++**
 - Example: Lichen
 - **Parasite – organisms that obtain their food from another organism (host) and usually harms the host organisms. Example: Tape worm +-**
 - **Commensalism – organism that one benefits and the other is unharmed. +0**
 - Do outdoor activity

Example of a Food Chain

- These different types of organisms make up food chains

Food Webs

- All the food chains in an area make up the **food web** of the area.

Food production and energy transfer

- Energy is the ability to do work and cause motion
- Energy is lost as heat at each level of consumption on the food Energy pyramid

Food Production & Usage

- Food is generally produced by plants through the process of photosynthesis
 - Chlorophyll is needed for photosynthesis
 - The green pigment in plants
 - Photosynthesis produces glucose which is the energy source for most living things
 - $\text{H}_2\text{O} + \text{CO}_2 + \text{Light} + \text{chlorophyll} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + \text{O}_2$
 - The process of consumers using the energy found in glucose is *respiration*
 - $\text{C}_6\text{H}_{12}\text{O}_6 + \text{O}_2 \rightarrow \text{CO}_2 + \text{H}_2\text{O} + \text{energy}$

Producer/Consumer Interaction

- **Plants are called producers (energy packagers)**
 - **Food chain**
 - **A series of producers and consumers that interact in a community**
 - **The way that energy flows through a community page 15**
 - **Energy is lost through each step**
 - **Food pyramid**
 - **Materials are recycled through a living system of organisms**

Uses of energy in organisms

- **Three main uses of energy in living things**
 - **Growth and Development**
 - **Maintenance and repair**
 - **Reproduction**

Growth & Development

- **1. Growth is an increase in the amount of living material in an organism**
- **2. Development – the series of changes an organism undergoes reaching its final form.**

Maintenance and repair

- **Maintenance – all things that maintain an organism**
 - a) **Balance of the organism.**
 - b) **Homeostasis**
- **Repair – replacing & repairing damaged parts**

● Homeostasis

- organisms - controlled responses to change.
- food supply
- toxic substances - avoided or eliminated.
- environmental conditions
- Internal conditions - tolerable ranges - pH, temperature
- controls - govern adjustments to changes in the internal and external environment.
 - may be needed to complete development.
 - at puberty, hormones trigger maturation

Reproduction

- reproduction - the production of offspring
 - a. sexual and
 - b. asexual
 - Attracting of the mate
 - Growth, development and care of the young

Organization –

- orderly function of living things (Result of heredity)
- **Multicelled organisms - increasingly complex levels**
 - molecular > organelle > cellular > tissues > organs > organ systems > organisms > populations > communities > ecosystems > biomes > biosphere.

Molecule

Organelle

Cells

Tissues

Organ

Organism
