

# Avogadro's Hypothesis and Kinetic Molecular Theory

- At given temperature all molecules have the same kinetic energy.  $KE = \frac{1}{2} mv^2$
- Pressure exerted by a gas is determined by the number of molecules in the gas and the speed that they travel
- Thus equal numbers must occupy equal volumes

# Gas laws and Ideal Gas Laws

- **Boyles Law**  $V=k/P$  or  $VP=k$
- **Charles Law**
  - $V=kT$  or  $V/T=K$

# Avogadro's Hypothesis

Equal volumes of gases at the same T and P have the same number of molecules.

$$V = n (RT/P) = kn$$

V and n are directly related.

twice as many molecules

# Molar Volume

- If the number of moles ( $n$ ) are equal under similar Temperature and pressure then volume must be equal
- 1 mole of any gas will occupy  $22.4 \text{ dm}^3$  STP
- Ideal gas equation combines Charles and Boyles with moles ( $n$ )
  - $V=k(T/P)$  or  $PV = kT$
  - $k$  depends on the number of molecules or particles present and number of particles present is your number of moles
    - » If one mole occupies  $22.4 \text{ dm}^3$  @ STP then  $k$  has to include all of these (volume, pressure, temperature) and moles

# IDEAL GAS LAW

$$P V = n R T$$

Brings together gas properties.

Can be derived from experiment and theory.

**BE SURE YOU KNOW THIS EQUATION!**

# Gas and the Mole

- Since  $PV=kT$  and  $k$  must include moles and (temperature, pressure, volume)
- The (temperature, pressure, volume) of one mole is given the symbol  $R$ 
  - a) So  $k = nR$
  - b)  $R = \frac{(101.325 \text{ kPa}) (22.4 \text{ dm}^3)}{(1 \text{ mole}) (273 \text{ K})}$
  - c)  $R = 8.31 \text{ dm}^3 \cdot \text{kPa/mol} \cdot \text{K}$

# Using $PV = nRT$

$P$  = Pressure

$V$  = Volume

$T$  = Temperature

$N$  = number of moles

$R$  is a constant, called the **Ideal Gas Constant**

Instead of learning a different value for  $R$  for all the possible unit combinations, we can just **memorize one** value and **convert the units to match  $R$** .

$$R = 8.31 \frac{\text{dm}^3 \cdot \text{kPa}}{\text{Mol} \cdot \text{K}}$$

# Using $PV = nRT$

How much  $N_2$  is required to fill a small room with a volume of 960 cubic feet (27,000 L) to 745 mm Hg at 25 °C?

## Solution

1. Get all data into proper units

$$V = 27,000 \text{ L} = 27000 \text{ dm}^3$$

$$T = 25 \text{ °C} + 273 = 298 \text{ K}$$

$$P = 745 \text{ mm Hg} (101.3 \text{ kPa}/760 \text{ mm Hg}) \\ = 99.3 \text{ kPa}$$

And we always know R, 8.31  $\text{dm}^3 \cdot \text{kPa}/ \text{mol K}$

2. Now plug in those values and solve for the unknown.

$$PV = nRT$$

# Molecular Mass Determination

- Moles = mass/molecular mass or  $n=m/M$
- Then  $M=mRT/PV$

# Ideal Gas Law Questions

10

1. How many moles of  $\text{CO}_2(\text{g})$  is in a  $5.6 \text{ dm}^3$  sample of  $\text{CO}_2$  measured at STP?
2. a) Calculate the volume of  $4.50 \text{ mol}$  of  $\text{SO}_2(\text{g})$  measured at STP. b) What volume would this occupy at  $25^\circ\text{C}$  and  $150 \text{ kPa}$ ? (solve this 2 ways)
3. How many grams of  $\text{Cl}_2(\text{g})$  can be stored in a  $10.0 \text{ dm}^3$  container at  $1000 \text{ kPa}$  and  $30^\circ\text{C}$ ?
4. At  $150^\circ\text{C}$  and  $100 \text{ kPa}$ ,  $1.00 \text{ dm}^3$  of a compound has a mass of  $2.506 \text{ g}$ . Calculate its molar mass.
5.  $98 \text{ cm}^3$  of an unknown gas weighs  $0.087 \text{ g}$  at STP. Calculate the molar mass of the gas. Can you determine the identity of this unknown gas?

## Learning Check

Dinitrogen monoxide ( $\text{N}_2\text{O}$ ), laughing gas, is used by dentists as an anesthetic. If 2.86 mol of gas occupies a 20.0 L tank at  $23^\circ\text{C}$ , what is the pressure (kPa) in the tank in the dentist office?

# Learning Check

A 5.0 L cylinder contains oxygen gas at 20.0°C and 98 kPa. How many grams of oxygen are in the cylinder?

# GAS DENSITY

Low  
density

22.4 L of ANY gas  
AT STP = 1 mole

High  
density

# Mass/Gas/Volume relationships

- It is easier to measure the volume of a gas than its mass
- Measure volume under existing conditions and convert to STP to find mass
  - Solving Mass Gas Volume equations
  - Example: What volume of hydrogen at STP can be produced from the reaction of 6.54 g Zn with HCl
    - » Write balanced equation:  $2\text{HCl} + \text{Zn} \rightarrow \text{H}_2 + \text{ZnCl}_2$
    - » Find the number of moles of a given substance:  
6.54 g Zn ( $1 \text{ n Zn} / 65.4 \text{ g Zn}$ )
    - » Find mole ratio of given to mole ratio of required
    - » Express moles of gas in terms of volume  

$$6.54 \text{ g Zn} \cdot \frac{1 \text{ n Zn}}{65.4 \text{ g Zn}} \cdot \frac{1 \text{ n H}_2}{1 \text{ n Zn}} \cdot \frac{22.4 \text{ dm}^3}{1 \text{ n H}_2} = 2.24 \text{ dm}^3$$

# Gas Volume Mass Relationship

- Find the mass of a substance formed when the volume is known
- Example: How many grams of NaCl will result from the reaction of 112cm<sup>3</sup> of Cl<sub>2</sub> at STP with sodium
  - Determine the balanced equation:  $2\text{Na} + \text{Cl}_2 \rightarrow 2\text{NaCl}$
  - Change volume of gas to moles
  - Determine mole ratio
  - Convert moles to grams
  - $0.112 \text{ dm}^3 \text{ Cl}_2 \cdot \frac{1 \text{ mol Cl}_2}{22.4 \text{ dm}^3} \cdot \frac{2 \text{ mol NaCl}}{1 \text{ mol Cl}_2} \cdot \frac{58.5 \text{ g NaCl}}{1 \text{ mol NaCl}} = 585 \text{ g NaCl}$

# Volume Volume relationships

- **Example: How many dm<sup>3</sup> of O<sub>2</sub> are required to burn 1 dm<sup>3</sup> of CH<sub>4</sub>?**
- **Write the balanced equation CH<sub>4</sub> + 2O<sub>2</sub> → CO<sub>2</sub> + 2H<sub>2</sub>O**
  - $1 \text{ dm}^3 \text{ CH}_4 \cdot \frac{1 \text{ n CH}_4}{22.4 \text{ dm}^3} \cdot \frac{2 \text{ n O}_2}{1 \text{ n CH}_4} \cdot \frac{22.4 \text{ dm}^3}{1 \text{ n O}_2} = 2 \text{ dm}^3 \text{ O}_2$
  - **Solve by Inspection**
    - » **Since 22.4 dm<sup>3</sup> cancels out just use the gas Volume as the mole (n) ratio**
    - »  $1 \text{ dm}^3 \text{ CH}_4 \cdot \frac{2 \text{ dm}^3 \text{ O}_2}{1 \text{ dm}^3 \text{ CH}_4} = 2 \text{ dm}^3 \text{ O}_2$

# Gases and Stoichiometry

Decompose 1.1 g of  $\text{H}_2\text{O}_2$  in a flask with a volume of 2.50 L. What is the volume of  $\text{O}_2$  at STP?

**Bombardier beetle uses decomposition of hydrogen peroxide to defend itself.**

# Gases and Stoichiometry

Decompose 1.1 g of  $\text{H}_2\text{O}_2$  in a flask with a volume of  $2.50 \text{ dm}^3$ .  
What is the volume of  $\text{O}_2$  at STP?

## Solution

|                              |                              |                              |                     |
|------------------------------|------------------------------|------------------------------|---------------------|
| 1.1 g $\text{H}_2\text{O}_2$ | 1 mol $\text{H}_2\text{O}_2$ | 1 mol $\text{O}_2$           | 22.4 L $\text{O}_2$ |
|                              | 34 g $\text{H}_2\text{O}_2$  | 2 mol $\text{H}_2\text{O}_2$ | 1 mol $\text{O}_2$  |

= 0.36 L  $\text{O}_2$  at STP

# Gas Stoichiometry: Practice!

A. What is the volume at STP of 4.00 g of  $\text{CH}_4$ ?

B. How many grams of He are present in  $8.0 \text{ dm}^3$  of gas at STP?

## What if it's NOT at STP?

- 1. Do the problem like it was at STP. ( $V_1$ )
- 2. Convert from STP ( $V_1, P_1, T_1$ ) to the stated conditions ( $P_2, T_2$ )

Try this one!

How many dm<sup>3</sup> of O<sub>2</sub> are needed to react 28.0 g NH<sub>3</sub> at 24°C and 0.950 atm?

# Limiting Reactants

- Limiting reactant is the chemical which is completely consumed in the reaction
- Example How many grams of  $\text{CO}_2$  are formed if 10.0 g of carbon are burned in 20.0  $\text{dm}^3$  of  $\text{O}_2$ 
  - Write the balanced equation:  $\text{C} + \text{O}_2 \rightarrow \text{CO}_2$
  - Change both quantities to moles:  
Complete the problem based on the limiting reactant
