

Organic Chemistry

Organic chemistry

- **Organic compounds are compounds that contain carbon**
- **Carbon forms many compounds because:**
 - **Carbon forms covalent bonds**
 - **Covalent bonds can be single, double, or triple**
 - **Bonds easily with many different elements**
 - **Halogens**
 - **Nitrogen**
 - **Oxygen**
 - **Hydrogen**
 - **Atoms other than carbon can be at different places in the carbon chain**

Organic Compound Chemical Formulas

- **Formulas for organic compounds:**
Can be written the same as any other
example:
Methane – CH₄
Ethane – C₂H₆
- **Structural formulas are used to show a two dimensional shape**

Structural Formulas

- Structural formulas show every atom and every bond
- Atoms are represented by their atomic symbol
- Bonds are represented by solid black lines.
- A single black line represents 2 shared electrons in a single covalent bond
- Two black lines represent 4 shared electrons in a double covalent bond
- Three black lines represent 6 shared electrons in a triple covalent bond

Common Name	Molecular Formula	Lewis Formula	Structural Formula
Methane	CH ₄	$\begin{array}{c} \text{H} \\ \vdots \\ \text{H} : \text{C} : \text{H} \\ \vdots \\ \text{H} \end{array}$	$\begin{array}{c} \text{H} \\ \\ \text{H} - \text{C} - \text{H} \\ \\ \text{H} \end{array}$
Ammonia	NH ₃	$\begin{array}{c} \text{H} \\ \vdots \\ \text{H} : \text{N} : \\ \vdots \\ \text{H} \end{array}$	$\begin{array}{c} \text{H} \\ \\ \text{H} - \text{N} : \\ \\ \text{H} \end{array}$
Ethane	C ₂ H ₆	$\begin{array}{c} \text{H} \quad \text{H} \\ \vdots \quad \vdots \\ \text{H} : \text{C} : \text{C} : \text{H} \\ \vdots \quad \vdots \\ \text{H} \quad \text{H} \end{array}$	$\begin{array}{c} \text{H} \quad \text{H} \\ \quad \\ \text{H} - \text{C} - \text{C} - \text{H} \\ \quad \\ \text{H} \quad \text{H} \end{array}$
Methyl Alcohol	CH ₄ O	$\begin{array}{c} \text{H} \\ \vdots \\ \text{H} : \text{C} : \text{O} : \text{H} \\ \vdots \quad \vdots \\ \text{H} \quad \text{H} \end{array}$	$\begin{array}{c} \text{H} \\ \\ \text{H} - \text{C} - \text{O} - \text{H} \\ \\ \text{H} \end{array}$
Ethylene	C ₂ H ₄	$\begin{array}{c} \text{H} \quad \quad \text{H} \\ \vdots \quad \quad \vdots \\ \text{H} : \text{C} : \text{C} : \text{H} \\ \vdots \quad \quad \vdots \\ \text{H} \quad \quad \text{H} \end{array}$	$\begin{array}{c} \text{H} \quad \quad \text{H} \\ \diagdown \quad \diagup \\ \text{C} = \text{C} \\ \diagup \quad \diagdown \\ \text{H} \quad \quad \text{H} \end{array}$
Formaldehyde	CH ₂ O	$\begin{array}{c} \text{H} \\ \vdots \\ \text{H} : \text{C} : \text{O} \\ \vdots \quad \vdots \end{array}$	$\begin{array}{c} \text{H} \\ \diagdown \\ \text{C} = \text{O} \\ \diagup \\ \text{H} \end{array}$
Acetylene	C ₂ H ₂	$\text{H} : \text{C} \vdots \vdots \text{C} : \text{H}$	$\text{H} - \text{C} \equiv \text{C} - \text{H}$

Isomers

- **Isomer – compounds which molecular formulas are the same, but have different structural formulas. Structural formulas show the arrangement of the atoms**

Example:
Butane

Isobutane

These two
compounds
have much
different
properties

Vinyl alcohol (syn)

Vinyl alcohol (anti)

Acetaldehyde

Ethylene oxide

The more carbons present the more possible isomers there are.

Hydrocarbons

- **A compound that contain only hydrogen and carbon**
- **Vary from methane to waxes**

Two types of Hydrocarbons

- **Saturated**
- **Contain only single carbon bond and are called alkanes**
- **Unsaturated Hydrocarbons**
 - **These have double and triple bonds**
 - **Double bounds are called alkenes**
 - **Triple bonds are called alkynes**

Saturated and unsaturated oils in our diet

- Unsaturated are oils
- Saturated are fats

Polymers

- **Polymers are small organic molecules called monomers combined to form polymers**
- **Polymers make up most plastics and synthetic fibers: Dacron, nylon, polypropylene, polyvinyl chloride**

Soap & detergents

- **Soap**

- Long chains of hydrocarbons with sodium or potassium at one end
 - Soaps increase the cleaning ability of water
 - Hydrocarbon in soap dissolves the grease and the metallic end of the molecule combine with the water and washes grease away
 - Soaps are made by putting NaOH in fat or glycerol and then separating the results of reaction into bars.
 - This process with oils makes liquid soap
 - This process with fats makes solid bar soap
- Soaps can leave insoluble rings in a tub

Detergents

- use a negative ion instead of a positive ion to attract to the water and do not form scum or rings when used in hard water

Cationic Detergent

trimethylhexadecylammonium chloride

Petroleum

- mixture of hydrocarbons
- Crude oil – the organic mixture of hydrocarbons pumped out of the ground
- Separated into its parts by fractional distillation
- Is the result of plant and animal life from the past
- Fossil fuels are burned when oxygen and the fuel are combined with an activator
- The results of this combination of a hydrocarbon and Oxygen is CO₂ & H₂O
$$\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}$$

Substituted hydrocarbons

- Where another substance replaces the hydrogen

Alcohols are an example of a substituted hydrocarbon

Methanol CH_3OH

- Ethanol $\text{C}_2\text{H}_5\text{OH}$

Aromatic compounds

- The Benzene ring C_6H_6

Biological compounds

- **Proteins – are a polymer of amino acid monomers**
- **Nucleic Acids**
 - DNA – double sided polymer of nucleotide monomers
 - RNA
- **Carbohydrates – Polymer of sugar monomers called monosaccharides**
- **Lipids – Polymer from fatty acids and glycerol**
 - Cholesterol – waxy like fat found in the body that can build up in the arteries
- **Pheromones – Chemical that females of some species release to attract a male**
